Innovations for Sustainable and Resilient Infrastructure

Proceedings of International
Conference on Sustainable and
Resilient Infrastructure 2024
(ICSRI2024)

 Springer

Sustainable Civil Infrastructures (SUCI) is a series of peer-reviewed books and proceedings based on the best studies on emerging research from all fields related to sustainable infrastructures and aiming at improving our well-being and day-to-day lives. The infrastructures we are building today will shape our lives tomorrow. The complex and diverse nature of the impacts due to weather extremes on transportation and civil infrastructures can be seen in our roadways, bridges, and buildings. Extreme summer temperatures, droughts, flash floods, and rising numbers of freeze-thaw cycles pose challenges for civil infrastructure and can endanger public safety. We constantly hear how civil infrastructures need constant attention, preservation, and upgrading. Such improvements and developments would obviously benefit from our desired book series that provide sustainable engineering materials and designs. The economic impact is huge and much research has been conducted worldwide. The future holds many opportunities, not only for researchers in a given country, but also for the worldwide field engineers who apply and implement these technologies. We believe that no approach can succeed if it does not unite the efforts of various engineering disciplines from all over the world under one umbrella to offer a beacon of modern solutions to the global infrastructure. Experts from the various engineering disciplines around the globe will participate in this series, including: Geotechnical, Geological, Geoscience, Petroleum, Structural, Transportation, Bridge, Infrastructure, Energy, Architectural, Chemical and Materials, and other related Engineering disciplines.

**SUCI series is now indexed in SCOPUS
and EI Compendex.**

Abstract. Bituminous pavements are susceptible to moisture damage, leading to stripping. Glasphalt, a sustainable pavement material incorporating recycled glass as an aggregate, offers environmental benefits but remains vulnerable to moisture-induced damage. This study uses traditional tests and an innovative machine learning approach for image analysis to evaluate the moisture damage resistance of Zycotherm-modified glasphalt mixtures (containing 15% glass cullet). Glasphalt mixtures with varying Zycotherm content (0%, 0.2%, and 0.4%) were evaluated using the Modified Lottman test and boiling water tests. A digital image analysis approach employing machine learning was developed to transform visual stripping evaluations from boiling water tests. High-resolution images of the specimens were processed using MATLAB to quantify aggregate-binder interaction based on coating area, achieving a correlation coefficient of 0.9 with traditional assessments. Results showed that the mixture with 0.2% Zycotherm exhibited the highest moisture resistance, with TSR values improving from 83.2% in the control mix to 94.5% and a 59.95% reduction in white pixels, indicating significantly reduced stripping. This strong correlation between machine learning predictions and conventional tests demonstrates the potential of image analysis and machine learning to enhance moisture damage assessment in glasphalt pavements. This study shows that Zycotherm improves glasphalt mixture moisture resistance, enabling pavement construction to be more durable and sustainable.

Keywords: moisture damage · zycotherm · glasphalt · image processing · machine learning

1 Introduction

Bituminous pavements are fundamental to modern transportation infrastructure, providing durable and cost-effective surfaces for roads worldwide. However, these pavements are highly susceptible to moisture damage, which can severely compromise their structural integrity and longevity. Moisture damage, often manifested as stripping, occurs when water infiltrates the pavement layers. This problem is exacerbated in regions with
